6. TEST CONDITION

6.1. TEST CONFIGURATION

The device was configured for testing in a typical fashion (as a customer would normally use it). During the tests, the EUT and the supported equipments were installed to meet FCC requirement and operated in a manner which tends to maximize its emission level in a typical application.

6.2. EUT OPERATION

EUT was tested according to the following operation modes provided by the specifications given by the manufacturer, and reported the worst emissions.

7. CONDUCTED EMISSIONS TEST

7.1. LIMITS

According to section 18.307(c), Conducted Emission limits as following:

Frequency (MHz)	Maximum RF Line Voltage Q.P.(dBuV)
0.45-2.51	48
2.51-3.0	69.5
3.0-30	48

7.2. MEASUREMENT PROCEDURE

- The EUT was placed on a non-conductive table 0.8 m above the horizontal ground reference plane, and 0.4 m from the vertical ground reference plane, and connected to the main through Line Impedance Stability Network (L.I.S.N).
- The RBW of the receiver was set at 9 kHz in 150 kHz ~ 30MHz with Peak and AVG detector in Max Hold mode. Run the receiver's pre-scan to record the maximum disturbance generated from EUT in all power lines in the full band.
- For each frequency whose maximum record was higher or close to limit, measure its QP and AVG values and record.

7.3. BLOCK DIAGRAM OF TEST SETUP

7.4. TEST RESULTS

Correct Factor = Cable loss + Antenna Factor
Measurement = Reading level + Factor
Margin = Reading in reference to limit
“---” = The emission level complied with the limits, with sufficient margin, so no further recheck.

8. RADIATED EMISSION TEST

8.1. LIMITS

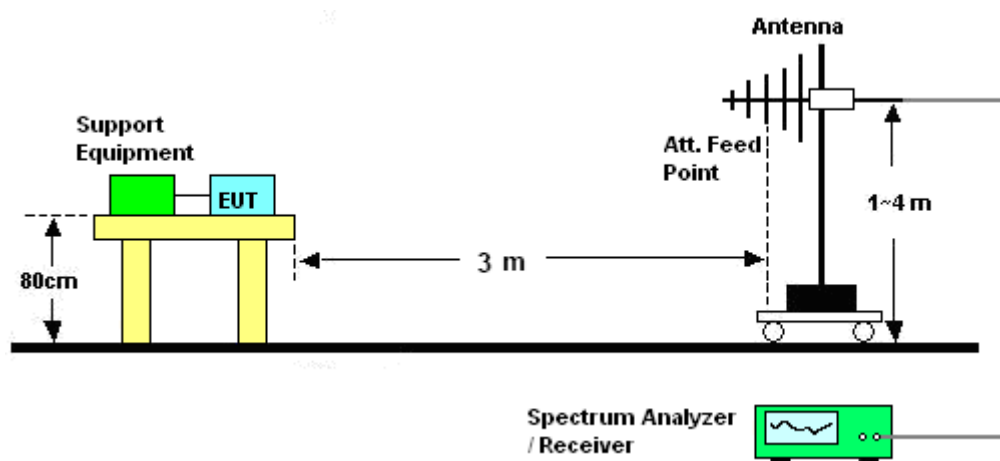

According to section 18.305(c), Radiated Emission limits as following:

Frequency (MHz)	Distance (m)	Maximum Field Strength Limit (dBuV/m Q.P.)
30-88	3	40.0
88-216	3	43.5
216-1000	3	46.0

8.2. TEST PROCEDURE

- The EUT was placed on the top of a rotating table 0.8 meter above the ground at a 3-meter chamber, and 3 meters away from the antenna mounted on a variable-height tower.
- Set the spectrum analyzer/receiver in Peak detector, Max Hold mode, and 120 kHz RBW in 30 MHz ~ 1 GHz. Record the maximum field strength of all the pre-scan process in the full band when the antenna is varied from 1 m to 4 m above the ground in both horizontal and vertical, and the turntable is rotated from 0 to 360 degrees.
- For each frequency whose maximum record was higher or close to limit, measure its QP value: scan the antenna from 1 meter to 4 meters and rotate the turntable from 0 to 360 degrees to find the height and degree where EUT radiated the maximum emission, then set the test frequency analyzer/receiver to QP Detector and specified bandwidth with Maximum Hold Mode, and record the maximum QP value.

8.4. TEST RESULTS

- Correct Factor = Cable loss + Antenna Factor
Measurement = Reading level + Factor
Margin = Reading in reference to limit
“---” = The emission level complied with the limits, with sufficient margin, so no further recheck.
